Trichomonas foetus Pooled Interpretation:

RT-PCR

Pooled samples are reported as "Not Detected" when no amplification is identified.

Pooled samples are reported as "Detected" when detectable amplification is identified. Samples from positive pools will be tested individually.

Pooled samples are reported as "Invalid" when inhibitors present in the pool prevent RNA amplification during testing. This is a preliminary result and all samples within the pool are tested individually to confirm results. See individual test results.
